

What is claimed is:

1. A compact disc recording device comprising: a housing; an audio data receiver arranged to receive audio data from outside the housing; a compact disc recorder located at least partially within the housing for recording onto a compact disc; and data storage memory located at least 5 partially within the housing for storing audio data received from outside the housing, said compact disc recording device configured such that a music library of sound tracks is storable in digital form in the data storage memory, said compact disc recording device including one or more manually operable function controllers on the housing, said compact disc recording device configured such that said music library is organizable into a song list and at least one group of 10 sound tracks wherein a group of sound tracks comprises at least one sound track from the song list, wherein said compact disc recording device is configured such that said one or more manually operable function controllers is useable to select a group of sound tracks to be recorded onto a compact disc and to record said group of sound tracks onto a compact disc using said compact disc recorder.

15

2. A compact disc recording device as recited in claim 1, further comprising audio output structure located at least partially within the housing for outputting audio signals, wherein said compact disc recording device is configured such that said one or more manually operable function controllers is useable to play at least one of a sound track and a group of sound tracks 20 stored in the data storage memory through the audio output structure.

3. A compact disc recording device as recited in claim 2, further comprising an amplifier located at least partially within the housing.

4. A compact disc recording device as recited in claim 3, said compact disc recording device
5 configured such that sound tracks stored in the data storage memory are selectively playable through the audio output structure.

10 5. A compact disc recording device as recited in claim 4, further comprising at least one manually operable function controller, configured such that said manually operable function controller is operable to adjust an output gain of said audio signals output through the audio output structure by said compact disc recording device.
